# Do your staff work in hazardous situations?

Are they physically vulnerable?

Is the equipment they use potentially dangerous?

Could they ever be exposed to sudden violence?

## Bellan Panic Alarms

Protecting lone workers

Designed to increase personal safety and security our Panic Alarms ensure that lone workers are able to call for assistance whenever required either automatically or on demand.

Using the latest communication technology the Panic Alarms use RF transmitters that generate signals which are picked up by a receiver module fitted to the operator's own vehicle. A GSM/GPS unit can be activated to raise the alarm enabling the swift despatch of assistance.

### Bellan Remote Panic Alarm

Attached to the belt or carried in the pocket, the Bellan Remote Panic Alarm is light, inconspicuous, robust and easy to use. With a transmission range of up to 400m the Bellan Remote Panic Alarm can be activated on demand by simply pressing the red panic button.

Ideal for lone workers that need to work away from their vehicles the Bellan Remote Panic Alarm enables the operator to work uninhibited without any restriction on movement with trigger security and immediate back up.

### Bellan Pendant Panic Alarm

Worn around the neck and secured by a neck lanyard the Bellan Pendant Panic Alarm is activated by the lone worker by either pressing the pendant transmitter or by breaking the lanyard itself.

With a transmission range of up to 150m the unit gives the user greater freedom of movement whilst providing increased protection and security with added neck lanyard activation.

### Bellan Active Panic Button

The Bellan Active Panic Button has been designed to provide security for those that work in and around vehicles.

The APB transmits signals or 'welfare checks' that require acknowledgement by the driver. If the driver fails to acknowledge a 'welfare check' the APB will trigger an alarm. If the lone worker should fail to acknowledge either alerts the APB assumes that the employee is in serious and imminent danger and automatically creates a 'man down' alert that is sent to a mobile phone or bureau.

### Bellan Lone Worker Movement Alarm

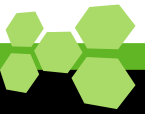

Attached to the belt, the Lone Worker Movement Alarm is a sensitive motion detector that registers the movements of the lone worker. It can be configured to send an alarm signal after a predetermined interval of motionlessness and has been designed to enable swift notification of woman/man down.

Designed for those situations where the lone worker is employed in a hazardous task and/or using hazardous equipment.

### Zoning

For large site applications Bellan Panic Alarms can be integrated into a zoned network, enabling workers to move between different operational areas. In the event of an alarm the position of the alarm activation can be verified and assistance swiftly deployed.

### Tracking / Telemetry

For practical, commercial and operational simplicity all Bellan Panic alarms integrate seamlessly with existing or proposed tracking/telemetry systems. If however there is no pre-existing GSM/GPS facility in place we are able to offer a cost effective system to meet the varied reporting requirements of the varied and diverse user groups.
